

- (19) [A] Pruning redundant or less significant rules.
- (20) [A] To calculate the computational complexity of the classifier.
- (21) [C] Accuracy.
- (22) [B] The no. of positive instances correctly classified as positive.
- (23) [A] Precision = $TP / (TP + FP)$
- (24) [B] F1-score
- (25) [B] The model has a low no. of false negatives.
- (26) [A] Decision Tree
- (27) [A] The model may suffer from overfitting.
- (28) [A] To calculate the computational complexity of the classifier.
- (29) [A] Pruning redundant or less significant rules.
- (30) [C] Accuracy.

- ① ~~The~~ [A] The regression line always passes through Mean x & y
- ② [C] Decision trees can be used for classification and regression
- ③ [C] Both a & b
- ④ [A] prone to overfitting.
- ⑤ [B] updating probabilities based on new evidence.
- ⑥ [B] The probability of event A given event B has occurred.
- ⑦ [D] 0.75
- ⑧ [C] Total no. of outcomes.
- ⑨ [A] 0.16
- ⑩ [B] conditional probability.
- ⑪ [A] The probability of HMM increases.
- ⑫ [B] $4/11$
- ⑬ [A] Machine learning
- ⑭ [B] It updates weight using the gradient of the loss function
- ⑮ [B] The model may overshoot the optimal weight values.
- ⑯ [D] Both a & b
- ⑰ [A] Decision Tree
- ⑱ [A] The model may suffer from overfitting
